Bouquet Descriptive Powders—All of the
bouquets which are used in the market
are prepared from the finest powders.

The following recipe shows how to
make a bouquet which will be highly
appreciated:

One pound of bouquets is made by
mixing one part of the finest powders
with one part of water, heating to a
boiling point, and then allowing to
cool. This mixture is then put into a
bottle and allowed to ferment for
seven days. The bouquets are then
removed, and the mixture is allowed to
ferment for another seven days. This
process is then repeated until the
bouquets are of the desired strength.

The following bouquet is prepared
